Occurrence of downy mildew on spinach varieties in plantings where the disease developed at farms in the northeast, 2014 to winter/spring 2023

Number in row 5 refers to planting. R=resistant (no or much fewer symptoms than other varieties); H=highly (used when difference was observed). Last row has race when identified for pathogen in the planting or guess based on DM ocurrence on varieties present. Multiple races have been found which explains variation in observed susceptibility of some varieties. Information on disease occurrence is from the grower.
